Denivet Julia

Project Summary

To begin with, during my school days, I did the conception and development of a mobile app. This app is a shop for my teammates Luc. Luc is a photographer and he is passionate about that. Before that we decided to create this app, he only had instagram to post his shootings
.
The problem was the following : Luc needed more visibility, more photo models and maybe something that could help him to buy all he needed for his passion.

Also, we chose to do a shop which sells some pictures from shootings that Luc did before. This app is an opportunity for Luc to gain visibility for his skills and passion. On this app, we will see some architecture, landscape and photo models.

In addition to that, the app enables you to purchase his photoshootings and the money raised is spent to enhance his work equipment in order to always get the highest quality of photoshootings.

Furthermore, as a technical part, we decided to do an API RESTFUL for the back-end part and do a mobile application for the front-end part. We developed our API with codeigniter which uses the language PHP. Finally, the front-end was made with React Native which uses Javascript (XML).

In Fine, if by any chance you are interested in Luc's work you can find it on the app Luc's contact details to call him or send him a mail.
